How to install the Point65 Rudder

The Point65 Rudder for USA and Canada has been designed to fit all the Point65 models except the Martini.

The Whisky 16 which have been sold as skeg only model will not have a rudder sleeve installed, but it can in most cases be installed with some difficulty.

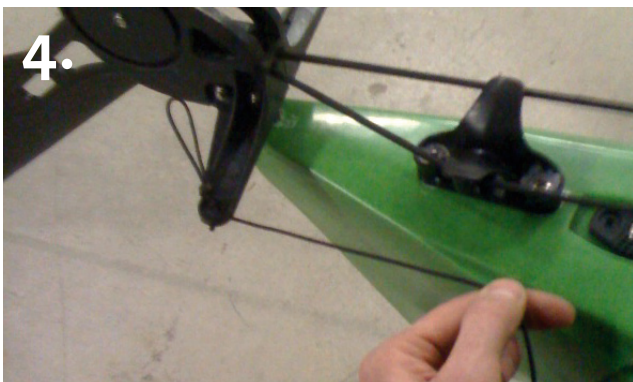

Install the rudder into the Rudder sleeve at the back of the kayak. Make sure the Rudder is turned as much toward the front as possible and turn it. In this position you should not be able to lift the rudder out of the rudder sleeve. If you can, you should turn it back into position and push down even further.
(the rudder in this image is different, but the same method is applied)

Make a bend in the rudder line as on the image above, and push the doubled up end through the hole in the rudder wing.

Pull the ready made loop at the end of the rudder line through the bend which was pulled through the hole.

Pull the line tight so to fasten the loop. With this quick release knot, you can easily dismantle the rudder when transporting the kayak on land.

Tighten the rudderlines when sitting in the cockpit by adjusting the mini-line lockers. To tighten, pull the miniline locker towards the back. To loosen the lines do as on image above.
